

SIDE BRACE

Our side brace is our most common application, fitting 90% of all lift applications. This allows the travel beams to be perpendicular to the structure and also allows for two gate openings on the basket—one on the structure side and an optional second gate opening on one of the other two available sides of the basket.

NOTE: Gate opening on the 'back side' (or the 'travel beam' side) of basket is not an available option.

BRACE OPTIONS ATTACH
TO THE STRUCTURE AT TWO
POINTS—THE GROUND AND THE BRACE.**

VERTICAL BRACE

Galaxy's second most commonly used brace is our vertical brace. This brace allows the travel beams to be flush against a structure. This brace is often used in an interior shaft application or when the lift/basket needs to travel through the structure/deck.

ARROWHEAD BRACE

Galaxy's arrowhead brace allows yet another option on our custom designed lifts. This brace adds additional support and safety when the lift needs to be flush with the end of the structure, assuring a fully supported installation.

HORSESHOE BRACE

The horseshoe brace, though not as common, is used when structures only allow for one opening, and available space only allows for the travel beams to be parallel to structure. Just one more example of our commitment to our customer to meet every cargo lift need.
